ALIGNMENTS

AAR06310 standard; protein; 15 AA. 04-DEC-1990 (first entry) retanus toxin epitope. AAR06310; RESULT 1 AAR06310

Tetanus toxin; vaccine; major histocompatibility complex; MHC; antimalarial.

Synthetic.

25-JUL-1990. 3P378881-A.

89EP-0203318. 89IT-0022409. 89IT-0019110. 27-DEC-1989; 16-NOV-1989; 17-JAN-1989; (ENIE) ENIRICERCHE SPA.

Pessi A, Bianchi E, Verdini AS, Corradin G;

WPI; 1990-225582/30.

Synthetic peptide(s) corresp. to tetanus toxin epitope(s) - used as universal carriers for prepn. of immunogenic conjugate(s) for use as vaccines.

through a linker to a solid phase, forming a complex of (A)-solid phase.

Where (A) comprises 10-50 amino acids capable of forming a secondary structure in a benigh buffer after liberation from the solid phase, and turther the (A)-solid phase complex comprises an immunogenic substance and/or an immune mediator coupled on (A). The present sequence composents a peptide used in an example from the present invention. An represents a peptide used in an example from the present invention of chemical derivatives, characterised by covalently attaching molecules at attachment points. Alternatively (A) is used as a scaffold peptide for the incorporation into an Immunostimulating Complex (Iscom) resulting an (A)-iscom complex which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with higher applies having fibronectin., laminin. Or vitronectin-like the production of the chemical coupling of antigenic continue and the new constant the most of the chemical coupling of antigenic constant the most of the chemical coupling of antigenic constant the most of the chemical coupling of antigenic constant the most of the chemical coupling of antigenic constant the most of the chemical coupling of the chemical coupling of antigenic constant the most of the chemical coupling of the chem

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Non-dendritic peptide carrier linked to a solid phase - useful as a
                               Epitopic peptides may be used with synthetic hapten derived from a pathogen to generate an immune response to the pathogen. Peptides are recognised by numerous Thelper cell clones within the context of a wide range of alleles of the human MHC. The peptides may be used in an antimalarial vaccine inducing Ab. response to P.falciparium.
                                                                                                                                                                                                                                             ;

agent. Such diagnostic-(A) molecules could be used to detect molecules derived from or indicative of pregnancy or of a disease, such as an infectious, autoimmune or cancerous disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic DNA coding for the wild-type universal Th epitope from tetanus toxoid, designated TT830, was fused to the 3'-end of DNA encoding heavy chain sequences from the humanised anti-Fc gamma RI monoclonal antibody H22. The resulting fusion protein was shown to be significantly more efficient in antigen presentation and T cell stimulation that the TT830 epitope alone. A similar fusion construct was prepared coding for a mutant, antagonistic form of the epitope (designated TT8335) fused to the anti-Fc gamma RI. The Inhibiting T cell activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Humanised antibody; anti-Fc receptor; H22; bifunctional; bispecific; fusion protein; chimera; tetanus toxoid; helper T cell epitope; antigen presentation; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrimeric poly-lysine enabling multiple eptitopes to be covalently attached to it. Also claimed are: (1) an antibody purified from biological fluid or cells of organisms administered with the carbohydrate peptide conjugate, and (2) a diagnosis kit comprising antigen-specific antibodies elicited by immunisation with the carbohydrate peptide conjugate. The peptide conjugate, antibody and diagnosis kit are used to provide pharmaceutical compositions and vaccines against tumours. These can be used to support an immune response against viral infections caused by hepatitis virus, HIV or cytomegalo virus. They can be used to enhance immune responses, especially B- and reall responses, of humans and animals against bacterial infections. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          carbohydrate peptide conjugate stimulates the antibody and T-cell response without stimulating undesired immune responses. The composition is capable of increasing the survival of tumour bearing humans and animals. The present sequence corresponds to residues 830-844 of tetanus toxin. The synthetic peptide corresponding to this sequence may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

AAW71321-22 represent universal helper T-cell epitopes derived from tetanus toxin. They are used to enhance host immune response to vaccines. The specification describes a plasmodium yoelil liver stage 17 kba hepatic and erythrocytic stage protein designated PyHEPI. This protein elicits a response from an Igl monoclonal antibody designated say Yoelil Liver Stage 3 (NTLS3). This antibody does not recognise sporozoites, but does recognise P. yoelil liver stage parasites. NTLS3 eliminates upto 90% of liver stage parasites. The specification describes a vaccine for reducing the severity or incidence of infection by a malaria parasite of the PyHEPI7 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine for protecting mammal against infection by malaria caused by Plasmodium species - comprises a first nucleic acid encoding a first polypeptide capable of eliciting an immune reaction against an antigen expressed during the liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

This sequence represents a tetanus toxoid epitope and is recognised by the multispecific single chain antibody designated H22. The antibody can be used in the method of the invention for inducing antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal growth factor receptor (EGFR), comprises contacting the tumour cell with a multispecific protein molecule (preferably a single chain antibody) comprising: (a) an anti-Fc receptor antibody or an antigen binding fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which binds to HER 2/neu; and (c) a portion which binds to HER 2/neu; and (c) a portion which binds to HER 2/neu; and (c) a portion which
                                                                                                                                            The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a T-cell epitope peptide used to generate the chimeric peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Multispecific single chain antibody; antibody H22; tumour cell; therapy; antibody-dependent cellular cytotoxicity; ADCC; HER 2/neu; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Specific killing of tumour cells - using a multi-specific molecule comprising an anti-Fc receptor antibody and a portion which binds to a target cell
                                                            Synthetic chimeric fimbrin peptide – useful for vaccination against non-typable Haemophilus influenzae

                                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses new covalently reactive antigen analogs (CRAA) of formula X1-Y-E-X2, in which X1 and X2 represent peptide sequences of an epitope of a disease-associated protein, Y is a positively charged amino acid residue, preferably Lys or Arg, and E is an electrophilic reaction centre, preferably Lys or Arg, and E is an electrophilic reaction centre, preferably a phosphonate or boronate moiety. Depending on the identity of the epitope, the CRAA may be used to stimulate production of catalytic antibodies specific for predetermined antigens associated with particular medical disorders. They may also be used to permanently inactivate endogenously produced catalytic antibodies produced in certain autoimmune diseases as well as in certain lymphoproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          421-436 of a B-cell epitope of gp120 (see AAY04046) which may be used to counter HIV-1 infections. When used as an immunogen, preferably this CRA is conjugated at its N-terminal to a T-helper epitope from tetanus toxoid. The present sequence represents the T-helper epitope and
                                                                                                                                                                                                                                                                            New covalently reactive antigen analogs used for treating e.g. autoimmune diseases, lymphoproliferative disorders, cancers, microbial infections, ischemic and reperfusion injury or septic shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chimeric; non-typable Haemophilus influenzae; fimbrin; T-cell epitope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               T-cell epitope peptide #4 for chimeric fimbrin/T-cell epitope peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                 ö
  breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Asthma; IL-5; interleukin-5; allergy; cytokinė; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a compound (I) for the prevention and/or treatment of allergy. The compound comprises at least one allergen antigenic determinant (i) recognised by a B cell of a non-atopic individual and at least one antigenic determinant (ii) different from the allergen that triggers T cell activation. (I) has antiallergic, antiasthmatic. antiinflammatory. dermatological and immunosuppressive activities, and can be used in a vaccine. (I) may be used in a pharmaceutical or cosmetic medicament to treat and/or prevent allergies or a disease of allergic origin, especially hypersensitivities. These include rhinitis, shnusitis, bronchial asthma, atopic dermattlis, some forms of acute and chronic uricaria, gastro-intestinal syndromes associated with the ingestion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            food allergens, oro-pharyngeal syndrome, anaphylactic reactions associated with drug hypersensitivities and/or a mixture of these. The use of (I) in the treatment of allergic conditions avoids the need for drug treatment, which often causes undesirable side-effects. Also, prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New compound for prevention and treatment of allergies comprises at least one allergen antigenic determinant recognized by a B cell and at least one antigenic determinant which does not trigger T cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 art drug therapies alleviate symptoms, but do not influence their causes, however (I) actually combats the cause of an allergic reac

The present sequence represents the tetanus toxoid P2 epitope. It is used to create a fusion protein with murine osteoprotegerin ligand (10PGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OpCL protein is synthesised as a type II cansmembrane protein. The murine and human OpCL polypeptides are 87% homologous. OpCL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast conformation in the absence of CSF-1. OpCL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-requisation of OpCL activity in an animal. The method comprises down-requisation of OpCL polypeptide or subsequence, and/or at least one OpCL polypeptide are useful for treating, preventing and ameliorating contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant protein; CDC/NIIMALVAc-1; multivalent; malaria; vaccine; T-cell epitope; tetanus toxoid; antigenic epitope; treatment; circumsporozoite protein; CSP; sporozoite surface protein-2; SSP-2; liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; MSP-1; apical membrane antigen-1; AMA-1; erythrocyte binding antigen-175;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         In vivo down-regulation of osteoprotegerin ligand (OPGL) activity used
                                        Osteoprotegerin ligand; OPGL; osteoprotegerin; osteoclastogenesis; tumour necrosis factor receptor; type II transmembrane protein; osteoclast differentiation; CSF-1; osteoclast activator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Clostridium tetani tetanus toxoid T-cell epitope, P589.
Amino acid sequence of the tetanus toxoid P2 epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 74; DB 21;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunogenic cell-associated peride antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              foreign to the animal. Analogues of human PSM, human Her2 and human/muthe FGPB comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope (e.g. P2 and/or P30) are also claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The claims detail a method for inducing immune responses against weakly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively.
                                                                                                                                                                                                                  Foreign epitope; P2; prostate specific membrane antigen; PSM; Her2; Heregulin 2; Fibroblast growth factor 8b; FGF8b; vaccination; cytotoxic T-lymphocyte immunity; self-protein; cancer; breast cancer; prostate cancer; cell-associated peptide antigen:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nielsen KG, Haaning J, Leach D, Dalum I;

                                                                                                                                                                                                                                                                                                          The present sequence is the tetanus toxoid T-cell epitope P589, derived from Clostridium tetani. It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSP-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Surface layer protein; S-layer secretion signal; antibiotic; vaccine; recombinant fusion protein cleavage; enzyme; protein polymer; foodstuff; antibacterial enzyme; surface glycoprotein; T-cell activating epitope; P2; tetanus toxoid; IPNV; Infectious pancreatic necrosis virus.

The patent discloses a method for cleaving a recombinant fusion protein which is produced by Caulobacter and consists of Caulobacter surface which is produced by Caulobacter and consists of Caulobacter surface layer (S-layer) protein (containing the C-terminal secretion signal) and a target protein protein is carried out under mild acid conditions so that cleavage occurs at aspartate-proline dipeptide site without solubilising the protein. The Caeavage is accomplished while the fusion protein is in an insoluble aggregate form which facilitates purification of the protein. The method is useful for producing pure proteins including recombinant human and animal therapeutic antiblotic and vaccine peptides, enzymes, protein polymers, and antibacterial enzymes for foodstuffs.

The present sequence is a T-cell activating epitope P2 derived from tetanus toxold protein. This sequence was fused to a DNA encoding a from tetanus toxold protein. This sequence was fused to a DNA encoding a fragment of Infectious pancreatic necrosis virus surface glycoprotein which is a vaccine candidate. This chimeric protein was in turn fused to DNA encoding C crescentus S-layer secretion signal (corresponds to the C-terminal portion of the S-layer protein from amino acid 690 onwards and contains native Asp-Pro site) for construction of a recombinant contains native which is expressed in Caulobacter and then cleaved
                                                                                                                                                                                                                                                                                                                                                         Cleavage of Caulobacter produced recombinant fusion proteins useful for producing vaccine peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amyloid protein; neuroprotective; nootropic; immunostimulant; vaccine;

The invention relates to a method for in vivo down-regulation of amyloid protein such as beta amyloid (Abeta) in an animal, including human. The In vivo down-regulation of amyloid protein for the treatment of Alzheimer's v. comprises presenting an amyloidogenic polypeptide or its subsequence and/or at least one analogue of the amyloidogenic polypeptide to the immune system Example 3; Page 117; 120pp; English.

method comprising presenting to the animal's immune system an immunogenically effective amount of at least one amyloidogenic protein or its subsequence and/or at least one analogue of the amyloidogenic protein or its subsequence, and its polypeptide. The amyloidogenic protein or its subsequence, and its analogue is useful for the preparation of an immunogenic composition comprising an adjuvant for down-regulating amyloid in an animal. They are also useful in the treatment, prophylaxis or amelioration of Alzheimer's disease or other diseases characterised by amyloid deposits. They are also useful in the treatment of systemic amyloidosis, maturity onset diabetes, Parkinson's disease, Huntington's disease, fronto-temporal dementia, amyotrophic lateral sclerosis (ALS), pick's disease and prion-related transmissable spongiform encephalopathies. They are also useful for inducing production of antibodies against an amyloidogenic polypeptide. The present sequence is clostridium tetani P2 epitope related to the invention

-I FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

-I FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEN PROSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC

ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GIN-|-PHE-77
                                                                                                                                                                                                                                                                                                                                                                                                      SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE AND ARE NON-TOXIC AFTER SEPARATION.

-1- CATALYTIC ACTIVITY: [Acyl-carrier protein] + H(2)0 - 4'-
phosphopantetheine + apoprotein.
-1- SIMILARITY: BELONGS TO THE ACPD FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                    Chandler M.S., Smith R.A., "Characterization of the Haemophilus influenzae topA locus: DNA topoisomerase I is required for genetic competence."; Gene 169:25-31(1996).
